Edge Metals manual

Edge Metals books containers, buys the metal that goes in them, sells it on, and produces the paperwork that moves it. This manual covers that work end to end: the booking, the supplier bill, the customer invoice, and the documents a buyer and a broker actually receive.

It is not the yard manual. Edge Yard and Edge Metals are separate companies and separate money — a rule for one is not a rule for the other, and that separation is most of what this software is for.

1. How the work fits together

One container passes through four records, in this order. Each one is a different question, and getting them confused is the commonest way the numbers go wrong.

- **Booking** — the shipping line has given us space. Ports, dates, vessel.
- **Bill** — what we PAID a supplier for the metal in that container.
- **Invoice** — what we BILL a customer for it.
- **Documents** — the commercial invoice, packing list and BOL that travel with the shipment.

A booking with no bill is metal we have not bought yet. A bill with no invoice is metal we own and have not sold. The **Margin** view puts the two sides of the same container together, which only works if both were entered against the same booking and container number.

Booking number and container number, always both

A container number is not unique over time — MSKU1111111 sails again next year with different metal in it. The booking is what tells the two apart. Enter both on every bill and every invoice, spelled identically, or the container simply will not appear in Margin and nobody will be told why.

Signing in

Open jarvis.edgemetals.com. Everything in this manual needs an admin login — there is no separate Edge Metals sign-in, and a yard staff login is refused on every screen here.

2. Board — what needs attention today

The Board is the first screen after sign-in. It is not a list of everything; it is a list of what is at risk.

Figure 1 — the Board. The four counts split every active booking by how much trouble it is in; NEEDS ATTENTION below names the specific ones.

Reading it

- **HIGH RISK** — a cutoff or ERD is close and something is still missing.
- **MEDIUM RISK** — worth watching this week.
- **ON TRACK** — nothing outstanding.
- **COMPLETE** — shipped and done.

Each card under NEEDS ATTENTION shows the booking number, what is missing — "Awaiting supplier assignment" is the usual one — and a red tag with the deadline that is approaching: **ERD** (earliest receiving date) or **CUTOFF**.

The tags count in days. A booking showing **ERD · 2d** has two days before the port will accept the container. Clicking a card opens that booking.

3. Bookings — the shipping side

Every container the shipping line has confirmed. Grouped by port of loading, then by destination, because that is how a week's work is actually planned.

Figure 2 — the Booking ledger, grouped by port of loading. Each row is one booking with its dates and container count.

The five dates

- **ERD** — earliest receiving date. The port will not take the container before this.
- **CUTOFF** — the last moment it can be delivered to the port. Miss it and the container rolls to the next vessel.
- **ETD** — when the vessel is due to sail.
- **ETA** — when it is due to arrive.
- **CONTAINERS** — how many are on this booking.

+ **ADD BOOKING** records a new one. **EDIT** corrects one; **DEL** removes it. The triangle at the start of a row expands it to show the individual containers and their stage.

The dates come from the carrier, not from us

When a carrier emails a revised cutoff, the booking must be updated to match — the Board works out what is at risk from these dates and nothing else. A stale cutoff means a container that looks safe on the screen and rolls in reality.

4. Bills — what we paid the supplier

One row per container bought. This is the cost side: the weighbridge figures, the supplier's price, the haulage, and what is still owed.

Figure 3 — Purchase bills. The strip across the top totals the whole filtered set; the filters below narrow it.

The totals strip

- **NET WEIGHT (LBS / MT)** — the metal, after every tare is deducted.
- **SUPPLIER INVOICE AMOUNT** — what the suppliers have billed.
- **PAYABLE** — that amount less the haulage we paid on their behalf.
- **BALANCE** — what is still outstanding after payments.

Those figures describe **the rows currently on screen**. Narrow by supplier or by date and they narrow with it — which is the point, and also why a total should never be quoted without saying what was filtered.

How a bill fills up

A bill is rarely complete in one sitting, and it is not meant to be. The weighbridge ticket, the supplier's invoice and the trucker's number arrive on different days, so a half-filled bill is a normal state and the row says what it is still waiting for.

The weights

Gross minus the tares — truck, container, chassis, boxes — gives **Net**. A tare left blank is reported rather than treated as zero: a missing tare would quietly inflate the net weight, and the amount is calculated from it.

The buttons

- **PAY** — record a payment to a supplier.
- **CLEAN NAMES** — merge spellings of the same supplier ("CALDERON", "calderon", "Calderon") into one.
- **IMPORT** — load a shipments workbook.
- **+ ADD BILL** — a new bill by hand.

5. Invoice register — what the customer owes

The sell side. One row per container invoiced, with the customer, the price, the terms and what has been received.

The screenshot displays the 'INVOICE REGISTER' interface. At the top, there are buttons for 'NEW FROM BILL', 'CLEAN NAMES', 'IMPORT', and '+ ADD INVOICE'. Below these are tabs for 'Outgoing', 'Incoming', 'Freight', 'Commission', and 'Margin'. A note states: 'TLU2110739 appears 3 times under NAMS234010 — usually a type, occasionally a container split across two invoices. Worth a look either way: the margin against Bills counts it twice.' The summary section shows: WEIGHT (MT): 12,638.53, INVOICE AMOUNT: \$21,476,711.58, COMMISSION: \$23,536.26, and RECEIVABLE: \$21,476,711.58. The search section includes fields for 'any field', 'CUSTOMER NAME' (set to 'All'), 'PAYMENT TERMS' (set to 'All'), 'ITEM' (set to 'All'), and date ranges 'FROM' and 'TO' (both set to 'MM/DD/YYYY'). A 'CLEAR' button is present. The main table lists invoice entries with columns: BOOKING NO, CONTAINER NO, DATE, WBL NUMBER, INVOICE NUMBER, CUSTOMER NAME, PAYMENT TERMS, SHIPMENT TERMS, and ITEM. The table contains 10 rows of data. A 'TURN ON VOICE' button is visible on the right side of the table.

Figure 4 — the Invoice register. The sub-tabs across the top switch between Outgoing, Incoming, Freight, Commission and Margin.

The five sub-tabs

- **Outgoing** — invoices raised to customers. The main list.
- **Incoming** — money received against them.
- **Freight** — freight charges, and which side carries them.
- **Commission** — what an agent is owed, per metric ton of the invoiced weight.
- **Margin** — cost and revenue for the same container, side by side.

Weight and price

Weight is entered in **pounds** unless stated otherwise. Price is read as **per pound under \$10** and **per metric ton at \$10 and above** — so 0.548 is per lb and 880 is per MT, and the amount follows automatically. Type the total into **Invoice amount** instead when a flat figure was agreed, and that figure wins.

The banner at the top of the list

A line such as *"TLLU2110739 appears 3 times under NAM8234010"* is the register telling you one container is claimed more than once — usually a typo, occasionally a real split across two invoices. It is worth opening either way, because Margin counts both sides of that container and a duplicate is counted twice.

6. Documents — what the buyer and the broker receive

Everything that leaves the company is generated here: the commercial invoice, the packing list, the bill of lading and the proforma. These are the pages that go to a customer and to customs, so they are the ones worth slowing down over.

The screenshot shows a web interface for document management. At the top, there's a navigation bar with a link to the dashboard and a light mode toggle. Below this is a section for 'DOCUMENTS' with tabs for 'INVOICE', 'PROFORMA', 'BOL', 'PACKING LIST', and 'VERIFICATION'. The 'INVOICE' tab is active. The main content area is titled 'Who is the buyer?' and contains three search methods: 1. 'Who is the buyer?': A text input field with the example 'e.g. Taewon, Rad Metal, Joey/Daekwang' and a green 'FIND CONTAINERS' button. 2. 'Search by container #': A text input field with the example 'e.g. KOCU4877967 or KOCU4877967, TCLU7789012' and a green 'FIND BY CONTAINER #' button. 3. 'Search by Inv No.': A text input field with the example 'e.g. 26JY96 or 26JY96, 26JY97' and a green 'FIND BY INV NO.' button.

Figure 5 — the Documents screen, Invoice tab. Three ways in: by buyer, by container number, or by invoice number.

Finding the shipment

- **FIND CONTAINERS** — type a buyer and every container on record for them comes up.
- **FIND BY CONTAINER #** — one container, or several comma-separated to merge them onto one invoice.
- **FIND BY INV NO.** — reopen an invoice already raised.

Merging several containers onto one invoice is what the comma-separated box is for. Each keeps its own seal number and its own line on the printed document.

Invoice, packing list, or both

When generating, three shapes are offered and they exclude each other:

- **Normal** — one PDF, the invoice with its packing list behind it.
- **Separate invoice and packing list** — two PDFs, filed as a pair.
- **Invoice only** — no packing list at all, in the file or in the email.

Quantity is in METRIC TONS and the rate is per METRIC TON

The printed columns are headed "Quantity MT" and "Rate US\$/MT". Typing a weight in pounds into that first column produces a document whose money is correct and whose tonnage is nonsense — an invoice once left here stating **15,642 MT** where the packing list said **7.095**, and nothing on the page disagreed with itself in dollars. Jarvis now refuses to generate when a row's quantity does not match its own weights; if it stops you, it has found something real.

Proforma

BACK TO DASHBOARD LIGHT MODE

// DOCUMENTS

INVOICE · PROFORMA · VERIFICATION

Generate, save, and re-open Commercial Invoices, Proforma Invoices, and carrier/commission verification checks.

INVOICE PROFORMA BOL PACKING LIST VERIFICATION

Type a customer name — if you've generated for them before, trade terms / port / item rates auto-fill from history. SET UP / UPDATE PRICING MEMORY

STEP 1 OF 3 SKIP — EDIT FULL FORM DIRECTLY

Who is the consignee?

Consignee name

start typing a customer name...

NEXT

SAVED PROFORMAS

FILE			
PROFORMA_Joey.pdf	Open	–	DELETE
260917_CW_263Y104_Jemulpo_Metal_Co_Ltd.pdf	Open	–	DELETE
260917_CW_263Y103_Jemulpo_Metal_Co_Ltd.pdf	Open	–	DELETE
260904_CW_263Y102_Jemulpo_Metal_Co_Ltd.pdf	Open	–	DELETE
260904_AC_263Y103_Daekwang.pdf	Open	–	DELETE

Figure 6 — the Proforma tab. Three steps, starting with the consignee; saved proformas are listed below and can be reopened or deleted.

A proforma is a quote, not a bill. Type a customer you have quoted before and the trade terms, port and item rates fill themselves in from what was agreed last time — check them rather than trusting them, because prices move and the memory does not know that.

SKIP — EDIT FULL FORM DIRECTLY jumps past the three steps when you already know exactly what you are raising.

7. Sending it

Documents are generated first and sent second, deliberately. Nothing is emailed as a side effect of making it.

From a sale, **Generate** walks three stops: choose the shape, look at the finished PDF, then read the draft email with the real address on it before pressing Send. You can stop at any of them.

Jarvis can also send an already-generated set: *"send the documents for HMMU7060866"*. It finds the invoice and packing list on file, works out the customer from the invoice itself, and shows the address for a yes or no before anything goes.

An email to a buyer cannot be recalled

Read the address, not the name. The recipient is worked out through two lookups you cannot see — container to consignee, consignee to contact — and a wrong contact is invisible until the address is in front of you. A commercial invoice carries our prices; it going to the wrong company is not a small mistake.

8. When something looks wrong

A container is missing from Margin

It has a bill or an invoice but not both, or the booking and container numbers do not match exactly between the two. Check the spelling on each side.

"This sale still needs..."

Generate refuses until the invoice number, customer, container number, weight, price and item description are all present. It lists the missing ones; fill them on the row and try again.

It refused to generate over the weights

A row's stated quantity disagrees with its own gross and tare. That is the check described on page 6 and it is almost always right. Look at the row before overriding it.

A supplier appears twice with different spellings

Use **CLEAN NAMES** on the Bills screen. It proposes one spelling and shows what it would change before changing anything.

Anything else

Say which screen, what you pressed, and what it said — word for word if there was a message on the page. The exact wording is usually enough to find it immediately.
